

Description

The Calesco gutter heater is a must have for safe removal of snow and prevention of those dangerous icicles on the gutters of houses and tall buildings.

The heater effectively heats the whole surface of the gutter, melting the snow as it makes contact with the gutter and heating foil. The snow is melted and the water is drained off through the heated downspouts to eliminate the risk of icicles forming.

In addition to the increased safety around the house or building, there is also less maintenance required and it eliminates the need for someone to be at risk of being on top of icy roofs shoveling snow. The heater can also have a significant economic impact on snow removal by eliminating the need for hiring expensive sky lifts or extra personal.

The installation is made easy for this thin flexible gutter heater system. There is no need to remove or replace any parts of the original gutter in order to add this heated system onto any house or building. The gutter heating system can be handled manually or controlled automatically via temperature and humidity sensors, depending on the surrounding conditions and the size of the system.

Technical specification

Length	6m/unit
Thickness	2 mm in resistant PVC
Operating voltage	42 Volt DC
Effect	35 W/m
Heating	+15°C relatively ambient
Fastener	Stainless steel spring clips

Benefits

- Safe removal of snow
- Prevents icicles
- Increased safety
- Easy installation

Application photo
